

Day 6 Notes

My First Feature: Product Pages (My Recap)

★ Today = my first real feature. I used Antigravity to build the product list and product detail pages, on my OWN branch, so I can't break the shared code.

1 My Own Branch

```
git checkout -b feature/store
```

This makes a new branch and switches me onto it. Everything I build goes here, not on main. main stays safe for both of us, until my work is tested and ready to merge.

2 What I Asked Antigravity to Build

Model: Claude Sonnet 4.5 (Thinking). The task had two parts:

- Server: add description and image_url to the products table, add 8 sample products, and add a route to get ONE product: GET /api/products/:id
- Client: a ProductList page (grid of cards: name, price, image) and a ProductDetail page for one product
- Routing: a different URL for each page, using react-router-dom
- No cart or checkout yet. One feature at a time.

3 New Idea: Routing

Routing = showing a different page for a different address, without reloading the whole site.

```
/          → product list (all products)
/products/3 → detail page for product with id 3
```

The :id in a route is a placeholder. The server (or page) reads the number from the address and loads that product.

4 Testing Before Trusting

```
cd client
npm install          → new libraries may have been added

cd server
node index.js        → start the server

cd client
npm run dev           → start the website
```

I checked the server first by opening `/api/products` in the browser. It showed all 8 products, each with a name, price, description and `image_url`. So the database and seed data worked.

5 *Problem I Hit*

At `/products/3` the page still said "Scaffold complete, features coming soon". That is the OLD placeholder from Day 5.

- The server was fine (the API showed products)
- So the problem was the FRONTEND, which wasn't showing the new pages

How to find out what's wrong:

```
git status          → did any files change in client/src?
dir client\src       → are there new files or folders (like pages)?
open App.jsx         → is it using the new pages?
```

Lesson: test the API and the page SEPARATELY. If the API works but the page doesn't, the bug is on the frontend side.

6 *Pushing My Branch*

```
git add .
git commit -m "Add product list and detail pages"
git push -u origin feature/store
```

`-u origin feature/store` connects my local branch to a branch with the same name on GitHub. After this first time, plain `git push` works.

7 *Why It Isn't on main*

On GitHub, the repo page shows `main` by default. My work is on `feature/store`, so it doesn't show up there. To see it, use the branch dropdown (top left) and pick `feature/store`.

To bring it into `main` later, we make a **PULL REQUEST**: a request to merge my branch into `main`, where we can check the changes first. We merge only after the pages really work.

Big takeaway:

Work on my own branch, test before pushing, and test the server and the page separately. Routing gives each page its own address. A pushed branch lives on GitHub but does not appear on main until it is merged with a pull request. Next: the shopping cart.
