

# Day 1 Notes

## Virtual Try-On Project – Setup Day

★ Today = no coding! Just getting our tools + GitHub repo ready.

### 1 Installed Tools

- ✓ Node.js (LTS) – from nodejs.org – checked with `node -v` and `npm -v`
- ✓ Git – from git-scm.com – checked with `git --version`
- ✓ Antigravity (AI coding IDE) – from antigravity.google – signed in with Google acc

### 2 GitHub Repo (Shared!)

Since I'm building this with a friend → repo should NOT be personal-only.

- Created repo on github.com → didn't tick "Add README"
- Went to Settings → Collaborators → Add people → added friend by username
- Friend accepts invite whenever free – doesn't block me from working!

### 3 Cloned Repo Locally

Made an empty folder first, then cloned into it using a dot at the end:

```
cd path\to\my\empty\folder
git clone <repo-url> .
```

⚠ Watch out: repo name must match EXACTLY (hyphens vs underscores broke it once!)

### 4 Core Git Loop

This is the loop I'll use constantly:

```
git status → see what changed
git add . → stage changes
git commit -m "message" → save a snapshot
git push → send it to GitHub
```

### 5 Branching Basics

```
git checkout -b test-branch → make + switch to new branch  
...edit files, then add + commit...  
git checkout main → switch back to main
```

Point: changes made on a branch stay OFF main until I merge them. Lets me experiment safely!

### *Big takeaway:*

Day 1 = environment ready + repo shared with my team + I understand add → commit → push → branch. No app code yet — that starts Day 5 with Antigravity!
