

Day 5 Notes

Getting the Real Project Running (My Copy!)

★ Today = big milestone! The real shared project scaffold exists now. My job today: pull it down and get it running on MY laptop.

1 Where the Scaffold Came From

Fahad used an AI coding tool called Antigravity to generate the project folders (no features yet, just structure) – React for frontend, Express + SQLite for backend.

I didn't need to generate it myself – we share ONE repo, so I just need to pull his work down and run it.

2 What I Did Today

```
cd Desktop\virtual_tryon
git pull → downloaded the new client/ and server/ folders
```

Important: node_modules folders are NOT stored in git (too big), so I had to install them myself:

```
cd server
npm install
cd ../client
npm install
```

3 The Folder Structure I Got

```
virtual_tryon/
├── client/          → React frontend (Vite)
│   ├── src/
│   │   ├── App.jsx
│   │   ├── main.jsx
│   │   └── index.css
│   ├── vite.config.js (has /api proxy → localhost:5000)
│   └── package.json
├── server/         → Express backend
│   ├── data/
│   │   └── store.db (auto-created, git-ignored)
│   ├── db.js       → sets up database + products table
│   └── index.js     → Express app, CORS, routes
```

```
├── package.json
├── .gitignore    → excludes node_modules, .env, *.db
└── README.md
```

Nice touches it added: a proxy in vite.config.js (so client can call /api/products instead of the full URL), and separating db.js from index.js to keep database code and route code apart.

4 *Running It Myself*

I ran both pieces on my own laptop to confirm it actually works for me too, not just for Fahad:

```
cd server
node index.js    → "Server running on http://localhost:5000"

(in a second terminal)
cd client
npm run dev      → http://localhost:5173/
```

Checked in browser: saw "Virtual Try-On Store" heading, and localhost:5000/api/products showed an empty array [] (expected, no data seeded yet).

5 *One Shared Project, Not Two Copies*

This scaffold lives in ONE shared repo. I didn't generate my own version — I pulled down Fahad's and ran it. That's the whole point of working from the same GitHub repo.

6 *The Plan From Here*

- Fahad → try-on / AI feature (pose detection, overlay)
- Me → e-commerce shell (product listing, cart, checkout) — MY main track starting now
- We'll each work on our own git branch, then merge together later

Big takeaway:

We now share ONE real project, running on both our laptops. node_modules has to be installed locally by each person (npm install), since it's not stored in git. From here, my actual feature work begins: product pages, cart, and checkout.
